

Product Suite Deployment Guide

Combined deployment pack for the unified dashboard, including Chainlink family models, Turbo family models, runtime files, and the exact signal logic currently live in the console.

Prepared: 09 Jun 2026

What To Send To Dev

- Send the whole folder named deployment 8th june 2026.
- That folder now contains the runtime files, config JSONs, builder references, and the combined explanation PDF/Word files.
- The dashboard runtime is the live_chainlink_product_suite_console HTML/JS plus server.mjs.
- The most important model files are chainlink_product_suite_final_models.json, chainlink_model2_smoothed_mr_models.json, chainlink_model3_fixed_window_models.json, and turbo_product_suite_final_models.json.

Bundle Inventory

File	Purpose	Status in deployment folder
live_chainlink_product_suite_console.html	Dashboard UI	present
live_chainlink_product_suite_console.js	Dashboard runtime logic	present
server.mjs	Local/API server	present
chainlink_product_suite_final_models.json	Chainlink Model 1 baseline	present
chainlink_model2_smoothed_mr_models.json	Chainlink Model 2	present
chainlink_model3_fixed_window_models.json	Chainlink Model 3	present
turbo_product_suite_final_models.json	Turbo bucket configs	present
build_chainlink_final_config.py	Chainlink builder reference	missing
build_turbo_final_config.py	Turbo builder reference	present
chainlink_models_1_2_3_guide_20260608.pdf	Chainlink model guide	present
product_suite_full_deployment_guide_20260609.pdf	Combined deployment guide	missing

Runtime Logic

- Every second, the dashboard updates the latest Chainlink, Turbo, Binance spot, and Binance perp prices and recomputes the selected model state.
- For bucket models, the runtime computes the selected lookback move, chooses the active bucket, and reads fair P(Higher) from the ladder.

- For legacy BTC Turbo short-tenor, the runtime uses the recovered fitted depth model rather than a simple bucket lookup.
- Fair MID is always computed first. User-selected edge is applied only after fair MID to generate the 2-way payout quote.

Chainlink Family

- Model 1 is the current deployed baseline in the dashboard.
- Model 2 is the smoothed mean-reversion alternative for 3m and above.
- Model 3 is the fixed-window Chainlink mean-reversion alternative: 2-minute lookback for 3m/5m/15m and 20-minute lookback for 1h.
- All three models share the same current short-tenor block for 30s and 1m in the runtime.

Shared 30s and 1m Runtime Block

Pair	Product	Source	Lookback	Style	Gate	Note
BTC/USDT	30s	Binance spot	10s	momentum	none	Shared across Models 1, 2, and 3 in the current runtime override.
ETH/USDT	30s	Binance perp	30s	momentum	$ \text{delta_gap_spot_30s} \geq 2\text{bp}$	Basis-gated short-tenor logic retained in all models.
BTC/USDT	1m	Chainlink	10s	mean reversion	none	Shared across Models 1, 2, and 3 in the current runtime override.
ETH/USDT	1m	Chainlink	60s	momentum	$ \text{delta_gap_spot_1m} \geq 3\text{bp}$	Basis-gated short-tenor logic retained in all models.

Model 1 Product Rules

Pair	Product	Source	Lookback	Style	Gate	Comment
BTC/USDT	30s	Binance spot	10s	momentum	none	Shared across Models 1, 2, and 3 in the current runtime override.
ETH/USDT	30s	Binance perp	30s	momentum	$ \text{delta_gap_spot_30s} \geq 2\text{bp}$	Basis-gated short-tenor logic retained in all models.
BTC/USDT	1m	Chainlink	10s	mean reversion	none	Shared across Models 1, 2, and 3 in the current runtime override.
ETH/USDT	1m	Chainlink	60s	momentum	$ \text{delta_gap_spot_1m} \geq 3\text{bp}$	Basis-gated short-tenor logic retained in all models.
BTC/USDT	3m	Chainlink	5m	mean reversion	none	best current medium-horizon reversal candidate
ETH/USDT	3m	Binance perp	15m	mean reversion	none	more robust than thin short-chainlink buckets
BTC/USDT	5m	Chainlink	5m	mean reversion	none	weak / low-confidence candidate only; keep mild
ETH/USDT	5m	Binance perp	10m	mean reversion	none	strongest robust mean-reversion

Pair	Product	Source	Lookback	Style	Gate	Comment
						product
BTC/USDT	15m	Binance spot	5m	momentum	none	short external move continuation dominates broader grid
ETH/USDT	15m	Binance perp	10m	momentum	none	short-to-medium external move continuation dominates; chainlink longer windows are secondary MR
BTC/USDT	1h	Binance spot	30m	momentum	none	2m was too short; 30m external continuation is dominant
ETH/USDT	1h	Binance perp	30m	momentum	none	2m was too short; 30m external continuation is dominant

Model 2 Product Rules

Pair	Product	Source	Lookback	Style	Comment
BTC/USDT	3m	Chainlink	5m	mean reversion	Use bucketed Chainlink move mean-reversion as fair MID, with weak buckets flattened and extremes capped.
ETH/USDT	3m	Chainlink	3m	mean reversion	Use bucketed Chainlink move mean-reversion as fair MID, with weak buckets flattened and extremes capped.
BTC/USDT	5m	Chainlink	30m	mixed	Use bucketed Chainlink move mean-reversion as fair MID, with weak buckets flattened and extremes capped.
ETH/USDT	5m	Chainlink	3m	mean reversion	Use bucketed Chainlink move mean-reversion as fair MID, with weak buckets flattened and extremes capped.
BTC/USDT	15m	Chainlink	30m	mixed	Use bucketed Chainlink move mean-reversion as fair MID, with weak buckets flattened and extremes capped.
ETH/USDT	15m	Chainlink	15m	mixed	Use bucketed Chainlink move mean-reversion as fair MID, with weak buckets flattened and extremes capped.
BTC/USDT	1h	Chainlink	30m	mixed	Use bucketed Chainlink move mean-reversion as fair MID, with weak buckets flattened and extremes capped.
ETH/USDT	1h	Chainlink	30m	mixed	Use bucketed Chainlink move mean-reversion as fair MID, with weak buckets flattened and extremes capped.

Model 3 Product Rules

Pair	Product	Source	Lookback	Style	Comment
BTC/USDT	3m	Chainlink	2m	mean reversion	Fixed-window architecture chosen for robustness

Pair	Product	Source	Lookback	Style	Comment
					and consistency across products, with smoothed MR ladders to reduce recent-window overfit.
ETH/USDT	3m	Chainlink	2m	mean reversion	Fixed-window architecture chosen for robustness and consistency across products, with smoothed MR ladders to reduce recent-window overfit.
BTC/USDT	5m	Chainlink	2m	mean reversion	Fixed-window architecture chosen for robustness and consistency across products, with smoothed MR ladders to reduce recent-window overfit.
ETH/USDT	5m	Chainlink	2m	mean reversion	Fixed-window architecture chosen for robustness and consistency across products, with smoothed MR ladders to reduce recent-window overfit.
BTC/USDT	15m	Chainlink	2m	mean reversion	Fixed-window architecture chosen for robustness and consistency across products, with smoothed MR ladders to reduce recent-window overfit.
ETH/USDT	15m	Chainlink	2m	mean reversion	Fixed-window architecture chosen for robustness and consistency across products, with smoothed MR ladders to reduce recent-window overfit.
BTC/USDT	1h	Chainlink	20m	mixed	Fixed-window architecture chosen for robustness and consistency across products, with smoothed MR ladders to reduce recent-window overfit.
ETH/USDT	1h	Chainlink	20m	mixed	Fixed-window architecture chosen for robustness and consistency across products, with smoothed MR ladders to reduce recent-window overfit.

Chainlink Ladder Appendix

- Bucket tables below show fair P(Higher) by bucket when the selected move is positive or negative.
- For Model 1, the table reflects the selected best-rule bucket studies for 3m and above.
- For Models 2 and 3, the table reflects the smoothed JSON ladders.

Turbo Family

- Turbo is restored as a second family tab in the unified dashboard.
- BTC 30s and BTC 1m use the recovered legacy short-tenor depth model from the earlier setup.
- ETH 30s and ETH 1m are now filled with Turbo own-feed replay logic instead of N/A.
- Turbo 3m and above use the existing 7-day own-feed bucket ladders.

Turbo Product Rules

Pair	Product	Source	Lookback	Style	Comment
BTC/USDT	30s	Binance futures BTCUSDT top-10 depth	10s	microstructure momentum	Recovered legacy BTC short-tenor depth model. Not a simple bucket ladder.
ETH/USDT	30s	Turbo feed	30s	mild mean reversion	New ETH short-tenor fill using 7-day own-feed replay with smoothed ladder.
BTC/USDT	1m	Binance futures BTCUSDT top-10 depth	10s	microstructure momentum	Recovered legacy BTC 1m variant with softer step scale.
ETH/USDT	1m	Turbo feed	10s	mean reversion	New ETH short-tenor fill using 7-day own-feed replay with smoothed ladder.
BTC/USDT	3m	Turbo feed	3m	mean reversion	7-day turbo own-feed backtest. Best lookback 3m. Smoothed bucket-by-bucket probability ladder derived from empirical move-bucket win rates. Lift vs flat base 27588.52.
ETH/USDT	3m	Turbo feed	3m	mean reversion	7-day turbo own-feed backtest. Best lookback 3m. Smoothed bucket-by-bucket probability ladder derived from empirical move-bucket win rates. Lift vs flat base 5753.46.
BTC/USDT	5m	Turbo feed	2m	mixed	7-day turbo own-feed backtest. Best lookback 2m. Smoothed bucket-by-bucket probability ladder derived from empirical move-bucket win rates. Lift vs flat base 4719.59.
ETH/USDT	5m	Turbo feed	5m	mean reversion	7-day turbo own-feed backtest. Best lookback 5m. Smoothed bucket-by-bucket probability ladder derived from empirical move-bucket win rates. Lift vs flat base 11156.37.
BTC/USDT	15m	Turbo feed	15m	mixed	7-day turbo own-feed backtest. Best lookback 15m. Smoothed bucket-by-bucket probability ladder derived from empirical move-bucket win rates. Lift vs flat base 15999.57.
ETH/USDT	15m	Turbo feed	15m	mixed	7-day turbo own-feed backtest. Best lookback 15m. Smoothed bucket-by-bucket probability ladder derived from empirical move-bucket win rates. Lift vs flat base 1411.71.
BTC/USDT	1h	Turbo feed	1h	mean reversion	7-day turbo own-feed backtest. Best lookback 60m. Smoothed bucket-by-bucket probability ladder derived from empirical move-bucket win rates. Lift vs flat base 1707.99.

Pair	Product	Source	Lookback	Style	Comment
ETH/USDT	1h	Turbo feed	15m	mean reversion	7-day turbo own-feed backtest. Best lookback 15m. Smoothed bucket-by-bucket probability ladder derived from empirical move-bucket win rates. Lift vs flat base 495.60.

Turbo Ladder Appendix

- BTC 30s and BTC 1m are legacy microstructure models, so they do not use the simple bucket table below.
- ETH 30s, ETH 1m, and all 3m-plus Turbo products below show bucket-based fair P(Higher) from the final JSON.

BTC/USDT 30s

Disabled in the raw Turbo JSON, but restored in the unified dashboard only where documented above.

ETH/USDT 30s
